01 DISTILLOGIC CAPABILITY

# Company Overview

DISTILLOGIC TECHNOLOGIES supports organisations that need accountable software engineering and technical delivery capacity.

We support enterprises, system integrators and technology organisations with software development, application modernisation, systems integration and delivery requirements. Engagements can cover specialist engineering capacity, dedicated teams, defined work packages, application modules or complete software projects.

Our operating model gives each engagement clear technical ownership, documented scope and measurable deliverables. Engineering practices and delivery controls are selected according to the client's architecture, standards and operational environment.

## Delivery principles

- Clear responsibility for scope, technical decisions and outcomes
- Structured engineering practices across development, testing and deployment
- Flexible engagement models that match the client's delivery organisation
- Measurable deliverables and controlled release processes
- Technical communication that makes progress, dependencies and risks visible

## Engagement scope

| Level of responsibility | How DISTILLOGIC can engage                                                            |
|-------------------------|---------------------------------------------------------------------------------------|
| Specialist capacity     | Individual engineers or specialists added to an existing delivery organisation        |
| Dedicated capability    | A stable team aligned with the client's roadmap, architecture and operating practices |
| Defined delivery        | A work package, application module or complete project with agreed deliverables       |
| Ongoing support         | Application maintenance, production support, enhancements and release management      |

02 DISTILLOGIC CAPABILITY

# Core Capabilities

The service portfolio covers application engineering, integration, modernisation, platforms, data, quality and ongoing application management.

| Capability                     | Representative scope                                                                                                                                                    |
|--------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Software Engineering           | Enterprise applications, customer and partner portals, backend systems, frontend applications, mobile applications, APIs, microservices and software modules.           |
| Systems Integration            | Enterprise APIs, third-party integrations, ERP and CRM connectivity, identity services, payment integrations, middleware, event-driven architectures and data exchange. |
| Application Modernisation      | Legacy assessment, refactoring, architecture improvement, technology migration, API enablement, cloud readiness and technical debt reduction.                           |
| Cloud and Platform Engineering | Cloud environments, containerisation, CI/CD, Infrastructure as Code, deployment automation, monitoring and production readiness.                                        |
| Data and AI Engineering        | Data pipelines, ETL/ELT, analytics platforms, LLM integration, retrieval-augmented generation, AI agents, machine learning and intelligent automation.                  |
| Quality Engineering            | Manual and automated testing, API and integration testing, regression testing, performance testing and release validation.                                              |
| Application Management         | Corrective maintenance, bug fixing, enhancements, production support, upgrades, release management and continuous technical improvement.                                |

## 03 DISTILLOGIC CAPABILITY

# Delivery Models

Engagement structures are selected according to scope, delivery ownership, duration and the client's internal organisation.

| Delivery model                                 | Typical use                                                                               |
|------------------------------------------------|-------------------------------------------------------------------------------------------|
| <b>Full Project Delivery</b>                   | A complete software project with an agreed scope, delivery plan and outcome               |
| <b>Work Package Delivery</b>                   | An independent technical scope delivered within a larger programme                        |
| <b>Application Module Delivery</b>             | A specific component or functional module with defined interfaces and acceptance criteria |
| <b>Dedicated Engineering Team</b>              | Ongoing engineering capacity aligned with the client's roadmap and standards              |
| <b>Engineering Squad</b>                       | A cross-functional team combining development, QA, DevOps and technical leadership        |
| <b>Specialist Engineering Capacity</b>         | Individual technical specialists integrated into an existing delivery organisation        |
| <b>Application Management</b>                  | Continuous maintenance, production support, upgrades and enhancements                     |
| <b>Subcontracting and Delivery Partnership</b> | Technical execution supporting system integrators, consultancies and prime contractors    |

## Delivery alignment

Before an engagement begins, the parties define the scope, responsibilities, dependencies, delivery milestones and acceptance approach in the relevant commercial agreement or Statement of Work.

04 DISTILLOGIC CAPABILITY

# Technology Coverage

Technology choices are aligned with the client's architecture, operational environment and project requirements.

| Domain                  | Technologies and platforms                                                                                         |
|-------------------------|--------------------------------------------------------------------------------------------------------------------|
| Application Engineering | Java, Spring Boot, C#, .NET, Node.js, TypeScript, Python, React, Angular, Next.js and Vue.js                       |
| Cloud and Platform      | Microsoft Azure, AWS, Google Cloud, Docker, Kubernetes, Terraform, CI/CD and Infrastructure as Code                |
| Data and AI             | Python, data engineering, ETL/ELT, LLM integration, RAG, AI agents, machine learning, NLP and predictive analytics |
| Data Platforms          | PostgreSQL, Microsoft SQL Server, Oracle, MySQL, MongoDB, Redis and OpenSearch                                     |
| Integration             | REST APIs, GraphQL, gRPC, Kafka, RabbitMQ, webhooks, OAuth 2.0, OpenID Connect and event-driven architecture       |

## Selection principles

- Compatibility with the client's existing systems and operational constraints
- Maintainability, security, observability and production support requirements
- Availability of skills, documentation and sustainable ownership
- Appropriate use of established platforms and project-specific engineering tools

05 DISTILLOGIC CAPABILITY

# Engineering Capability

Capability is structured by technical discipline, seniority and the responsibility assigned to each engagement.

| Engineering and architecture | Delivery and product disciplines  |
|------------------------------|-----------------------------------|
| Solution Architects          | Data Engineers                    |
| Technical Leads              | AI and Machine Learning Engineers |
| Backend Engineers            | QA Automation Engineers           |
| Frontend Engineers           | Software Test Engineers           |
| Full-Stack Engineers         | Project and Delivery Managers     |
| Mobile Engineers             | Business Analysts                 |
| DevOps and Cloud Engineers   | UI and UX Specialists             |

## Engineering lifecycle

Requirements > Architecture > Development > Code Review > Testing > Deployment > Monitoring > Continuous Improvement

Engineering practices may include source control, branch management, pull requests, code review, technical documentation, automated testing, CI/CD, controlled environments, secure development, observability and release validation.

Detailed technical profiles and capability matrices can be provided for a defined requirement. Certifications are presented only when supporting documentation has been verified.

06 DISTILLOGIC CAPABILITY

# Industries and Delivery Fit

DISTILLOGIC can support software and technology requirements across regulated, operational and digital business environments.

| Business and regulated environments | Operational and technology environments |
|-------------------------------------|-----------------------------------------|
| Financial Services and Banking      | Retail and Commerce                     |
| Insurance                           | Public Sector                           |
| Energy and Utilities                | European Institutions                   |
| Telecommunications                  | Healthcare and Life Sciences            |
| Transportation and Logistics        | Technology and SaaS                     |
| Shipping and Maritime               | Professional Services                   |
| Manufacturing and Industrial        |                                         |

## Why clients engage DISTILLOGIC

- Delivery focus. Responsibilities, deliverables and technical outcomes are made explicit.
  - Flexible engagement. Support can range from specialist capacity to complete project delivery.
  - Cross-functional capability. Software, cloud, data, AI, QA and delivery disciplines can be combined.
  - Client-aligned engineering. Technology and delivery practices adapt to the client's environment and standards.
  - Scalable capability. Team structure can reflect scope, technology, timeline and seniority requirements.
- Industry capability describes the environments that DISTILLOGIC can support. It does not imply previous client delivery unless a specific engagement is stated in writing.

| Telephone                     | Available on request              |

## Discuss a requirement

If your organisation requires a software project, technical work package, dedicated engineering team or specialist technology capability, DISTILLOGIC can review the requirement and propose an appropriate delivery structure.

## Complexity distilled. Technology delivered.
